/note="Vector: pT739-pac (Pharmacia) with a modified polylinker; Site_l: Not I; Site_2: Eco RI; The NIH_BMAP_M_S1 which in turn is a subtracted library derived from a mixture of normalized libraries from ten regions of the mouse brain (cerebellum, brain stems, olfactory bulbs, hypothalamus, cortex, amygdala, basal ganglia, pineal gland, striatum, hipoccampus) The driver used for subtraction consisted of a pool of 5,000 clones from the NIH_BMAP_M_S1 library and a pool of 5,000 clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CDNA Library Preparation: M.B. Soares Lab Clone distribution:
Researchers may obtain BMAP cDNA clones from RESEARCH GENETICS. It
should be noted that Bento Soares is generating a small number of
additional specialized non-redundant arrays of BMAP cDNAs whose
availability will be considered under appropriate and limited
collaborative arrangements The following repetitive elements were
found in this cDNA sequence: 103-164, >(CAG)n#Simple_repeat 320-363

followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI.XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy Shoemaker. 142 c 134 g 106 t

/clone=1cordanis yeas constructed according
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured RNA was size fractionated on a 1% agarose
gel: First strand cDNA synthesis was primed with oligo-dT
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with NotI and then cloned
directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is AGCGAGAGCA. This library was created for the University
lowa Brain Anatomy Project (BMAP): 'Gene Discovery in the
Developing Mouse Nervous System', supported by National
Institute of Mental Health (NIMH), Hemin Chin, Ph.D.,

by Stratagene. First strand cDNA synthesis was primed with a 50 blinker primer containing an oligo dT sequence preceded by a synthetic Xhoi site. 5 prime adaptors were preceded by a synthetic Xhoi site. 5 prime adaptors were used containing an ECORI cohesive end. The finished cDNAs were inserted in to the ZAP express vector. The finished cDNAs unidirectionally in the sense orientation with respect to the lac2 promoter of pBK-CMY. An amplified library was prepared from approximately 3 million primary clones in the lambda ZAP Express vector. In vivo excision was then used to generate individual pBK-CMY phagemid clones for

                                                                                                                                                             sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the NS3/NS4 region of HCV subtype 3a and is taken from a clone designated BR36-20-164.
                                                                                                                                                                                                                                                                                                                             Gaps
New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates
                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                   Length 133;

Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the particularly (1) the region spanning positions 664-4730 of the NS3 region of HCV subtype 3s; (1i) the region spanning positions 8023-8235 of the NS5 region of the BR36 captions 4892-5292 of the NS34 region of HCV type 3; (1ii) the region spanning positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV radion of HCV subtypes 3a and for serotyphing. This sequence corresponds to the NS3NS4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

                                                                                                                                                                                                                                                                                                                                                                                                                                      Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/F1 region of HCV subtype 3s, (ii) the region spanning positions 464-4730 of the NS3 region of HCV type 3; (iii) the region spanning positions 802-529 of the NS3 region of HCV type 3; (iii) the region spanning positions 803-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3s; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for secrotyphing. This sequence corresponds to the NS3/NS4
                                                                                                                                                                                                                                                                                                                                                                                                       1 QNEICLTHPITKYIMACMSADLEVTTSTWVLLGGVLAALAAYCLSVGCVVIVGHIELGGK
                                             New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates
                                                                                                                                                                                                                                                             and for serotyping. This sequence corresponds to the NS3/NS4 region of HCV subtype 3a and is taken from a clone designated BR36-20-165.

Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the N33/NS4 region of HCV subtype 3a and is taken from a clone designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV.
Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAA43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with degree differentiation was noted in the NS-5 (see AAR37923-26) and core region between type 1 sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS5 (see AAR37923-26) and core region between type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      7 THPITKYIMACMSADLEVITSTWVLLGGVLAALAAYCLSVGCVVIVGHIELGGKPAIVPD 66

The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HVV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ4058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS5 (see AAR37923-26) and core region between type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8 HPITKYIMACMSADLEVTTSTWVLLGGVLAALAAYCLSVGCVVIVGHIELGGKPAIVPDK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ43058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-5 (see AAR37923-26) and core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           68 EVLYQQYDEMEECSQAAPYIEQAQVIAHQFKGKVLGLLQRATQQQAVIEPIVTTNWQKLE 127

                                                                                                                                  The present sequence is a polypeptide comprising a 3023 amino acid sequence which is encoded by a cDNA (AAT13279) to a hepatitis C virus (HCV) genomic RNA. The protein can be easily detected by antibodies in an assay for the detection of HCV. The DNA and the protein are useful for classifying the subtype of HCV. At least a part of the protein may be used as a vaccine against HCV.

The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ4058-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS5 (see AAR37923-26) and core (Updated on 25-MAR-2003 to correct PN field.)

to the determination of functional HCV genomic RNA sequences, to construction of infectious HCV DNA clones, and to the use of the clones, or their derivatives, in therapeutic, vaccine and diagnostic applications. The invention is also directed to HCV vectors, e.g. for gene therapy or gene vaccines. The products and methods can also be used for identifying cell lines or animals that are permissive for infection with HCV, for studying HCV infection, isolating functional components of HCV, and for screening for agents capable of modulating HCV replication in vitro and in vivo.

                           The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4 region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a consensus sequence. Analysis of this and other regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non coding region (see AAQ4308-75) showed a difference of 9-14% in the nucleotide sequences between the three groups. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel type 0 f virus. Comparison of the N33 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same cegion between type 3 and type 1 sequences. (see AAR37923-26) and core region between type 3 and type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                              ö

The methods may be used to identify agents (antibodies, peptides and other non-peptidyl agents) that may be administered to treat hepatitis, cirrhosis or hepatocellular carcinomas and to diagnose these disease. The present sequence represents the amino acid sequence of HCV polyprotein (GenBank No. AF009606).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating hepatitis, cirrhosis or hepatocellular carcinoma by inhibiting binding between HCV envelope glycoproteins and DC-SIGN/DC-SIGNR proteins on the surface of cells -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to methods and agents for diagnosing and treating

                                                                          compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions of particularly (1) the region spanning positions of Core/E1 region of HCV subtype 3s; (ii) the region spanning positions 4080-5292 of the NS34 region of RCV type 3; (iii) the region spanning positions 8021-8215 of the NS5 region of HCV type 3; (iv) the credion spanning positions 8031-8215 of the NS5 region of the BR36 subgroup of HCV subtype 3s; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the N33/NS4 cregion of HCV subtype 3a and is taken from a clone designated
 New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates
                                                                                                                                                                                                                                                                                                                                                                                                             detection; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SerGlnAlaAlaProTyrIleGluGlnAlaGlnValIleAlaHisGlnPheLysGlyLys 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Compositions comprising at least 5, and pref. 8 or more contiguous nuclectides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/El region of HCV subtype 3s; (1i) the region spanning positions 4892-5292 of the NS3 region of HCV type 3; (1i) the region spanning positions 8023-8235 of the NS5 region of HCV HCP 5; (1v) the sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV for the detection of antibodies directed against HCV and for several and for serotyphing. This sequence corresponds to the NSS/NS4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      182
                                                                                                                                                                Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/E1 region of HCV subtype 3; (iii) the region spanning positions 464-4730 of the NS3 region of HCV type 3; (iii) the region spanning positions 4692-5292 of the NS34 region of HCV type 3; (iii) the region spanning positions 8022-8235 of the NS5 region of HCV type 3; (iv) the ER36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping. This sequence corresponds to the NS3/NS4 region of HCV subtype 3a and is taken from a clone designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 20

                                                                                                                                                                                                                                                                                                                                                                                                                              Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (i) the region spanning positions 417-957 of the Core/Fill region of HCV subtype 38; (ii) the region spanning positions 4802-529. of the NS3 region of HCV type 3; (iii) the region spanning positions 4802-529. of the NS3/4 region of HCV type 3; (iii) the region spanning positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an expense.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for serotyping.

(Updated on 25-MAR-2003 to correct PN field.)
                               HCV sequence used as hybridisation probe in identification method.
